Gene expression is the process by which the genetic code - the nucleotide sequence - of a gene is used to direct protein synthesis and produce the structures of the cell. Genes that code

Gene expression and regulation - A Leading UK University

The initial step in gene expression is the transcription of the DNA molecule into an exact RNA copy. As already discussed, the basic unit of heredity, the gene, is a double stranded DNA molecule and the information in the gene is encoded in the sequence of nucleotides. The transfer

Role of Chromatin in Gene Regulation • Two broad classes of chromatin: • Euchromatin : Majority chromatin is in its extended (decondensed) state ... which can recognize promotor and initiate gene expression. 28 Normal chromatin structure slows transcription. 29 Remodeling of chromatin mediates the activation of transcription. 30
